

Forklift Fork Positioner

Forklift Fork Positioner - A fork positioner is actually an apparatus constructed out of top quality materials meant to be able to withstand the most demanding procedures and work environments. This piece of equipment can enable the one driving to be able to control the blades hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the entire load or the arms in order to facilitate much more exact carrying and position in a faster and more effective way.

The fork pocket is quite unique and can enable the operator to be able to safely sway the blades into position without any worry of destroying the positioning cylinders. This allows the operator the alternative to perform simultaneous or independent fork movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are needed. Standard OEM carriages can be transformed into blade positioners on available units.
